Roman Aqueducts

CLACTON AQUEDUCT

✓function of the aqueduct.

Aqueducts were a very clever way to transport water from mountain springs to big cities like Rome. First used by the Romans in 31 BC to transport thousands of gallons of water into Rome. The water is kept in three tanks, one for the public drinking fountain, one for the wealthy and royal to use in private and one for the baths in

public. ■ Are there any aqueducts in Britain?
