

Tuesday 20th October

Layers of rock

Top Soil

Top Soil is a dark brown layer darker than the other layers. Lots of bugs and creepy crawlies live in the Top Soil. In the top layer the roots of the trees only go down to the top layer. ✓

Sub Soil

The Sub Soil is where the rocks have only just crumbled apart. And the soil is much lighter. In the sub soil no bugs go in there because it is too hard. ✓

Bed rock

Bed rock is the last kind of soil. Bed rock has not been broken up. It has not got any bugs in it because it is too hard. ✓

Soil formation

The rocks roll into to river and the water takes bits off. The water getting into the cracks, and it greases and making it even worse. When the sun is out and it makes him really big. When it is night and it is really cold it makes him very small. When
